

Python Assignment 11

1. Write a program which accepts one number and checks whether it is prime or not.

Input: 11

Output: Prime Number

Answer:

```
def CheckPrime(Number):  
    if (Number % 2 != 0):  
        print("This value is Prime : ", Number)  
    else:  
        print("This is not Prime Value")  
  
def main():  
    Value = int(input("Enter the number :"))  
    CheckPrime(Value)  
  
if __name__ == "__main__":  
    main()
```

2. Write a program which accepts one number and prints count of digits in that number.

Input: 7521

Output: 4

Answer :

```
def main():  
    print("Enter the digit")  
    digit = input()  
    print(len(digit))  
  
if __name__ == "__main__":  
    main()
```

3. Write a program which accepts one number and prints sum of digits.

Input: 123

Output: 6

Answer :

```
def add(value):  
    total = 0
```

```

while value > 0:
    total += value % 10 #remainder dete
    value //= 10       #last digit remove karte
return total

print("Addition of Digit is : ", i)

def main():
    print("Enter the Number")
    digit = int(input())
    Sum = add(digit)
    print("Sum of digit is : ", Sum)

if __name__ == "__main__":
    main()

```

4. Write a program which accepts one number and prints reverse of that number.

Input: 123

Output: 321

Answer :

```

def main():
    print("Enter the Number")
    digit = input()
    print("Reverse Digit is : ", digit[::-1])

if __name__ == "__main__":
    main()

```

5. Write a program which accepts one number and checks whether it is palindrome or not.

Input: 121

Output: Palindrome

Answer :

```

def main():
    print("Enter the number")
    number = input()
    reverse = number[::-1]
    if number == reverse:
        print("Number is Palindrome")

    else:
        print("Number is not Palindrome")

if __name__ == "__main__":
    main()

```
