

Python Assignment 18

1. Write a program which accept N numbers from user and store it into List. Return addition of all elements from that List.

Input : Number of elements : 6

Input Elements : 13 5 45 7 4 56

Output : 130

Answer :

```
from functools import reduce

def Add(iValue1,iValue2):
    return iValue1+iValue2

def main():
    Values = []
    while True:
        Data = input("Enter the Values : ")

        if Data == "":
            break

        Values.append(int(Data))

    Addition = reduce(Add,Values)
    print("Addition of All Numbers : ",Addition)

if __name__ == "__main__":
    main()
```

2. Write a program which accept N numbers from user and store it into List. Return Maximum number from that List.

Input : Number of elements : 7

Input Elements : 13 5 45 7 4 56 34

Output : 56

```
def main():
    Values = []
    while True:
        Data = input("Enter the Values : ")
```

```

        if Data == "":
            break

        Values.append(int(Data))
    print("Here is your List : ",Values)
    Largest = max(Values)
    print("Largest Value of List is : ",Largest)

if __name__ == "__main__":
    main()

```

3. Write a program which accept N numbers from user and store it into List. Return Minimum number from that List.

Input : Number of elements : 4

Input Elements : 13 5 45 7

Output : 5

Answer :

```

def main():
    Values = []
    while True:
        Data = input("Enter the Data :")

        if Data == "":
            break

        Values.append(int(Data))

    Lowest = min(Values)
    print("Your Lowest Value is : ",Lowest)

if __name__ == "__main__":
    main()

```

4. Write a program which accept N numbers from user and store it into List. Accept one another number from user and return frequency of that number from List.

Input : Number of elements : 11

Input Elements : 13 5 45 7 4 56 5 34 2 5 65

Element to search : 5

Output : 3

Answer :

```

def Count(iValues,iSearchingNumber):

```

```

    Cnt = 0
    for i in iValues:
        if i == iSearchingNumber:
            Cnt = Cnt + 1
    return Cnt

def main():
    print("Enter the Values : ")
    Values = list(map(str,input().split()))

    print("Enter the Searching Number : ")
    SearchingNumber = str(input())

    print("Your Number List is : ",Values)
    print("Your Searching Number is : ",SearchingNumber)

    NumberCount = Count(Values,SearchingNumber)
    print("Your SearchingNumber Count in List is : ",NumberCount)

if __name__ == "__main__":
    main()

```

5. Write a program which accept N numbers from user and store it into List. Return addition of all prime numbers from that List. Main python file accepts N numbers from user and pass each number to ChkPrime() function which is part of our user defined module named as MarvellousNum. Name of the function from main python file should be ListPrime().

Input : Number of elements : 11
 Input Elements : 13 5 45 7 4 56 10 34 2 5 8
 Output : 54 (13 + 5 + 7 + 2 + 5)

Answer :
 Main file : A18Q5.py

```

import ChkPrime
from functools import reduce

def main():
    print("Enter the list of Numbers :")
    Values = list(map(int,input().split()))

    print("Your Entered Number List is : ",Values)
    PrimeNumbers = list(filter(ChkPrime.CheckPrime,Values))
    print("Prime Numbers List : ",PrimeNumbers)

    PrimeAdd = reduce(ChkPrime.PrimeAddition,PrimeNumbers)
    print("Addition Of Prime Numbers is : ",PrimeAdd)

if __name__ == "__main__":

```

```
main()
```

User Define Module : ChkPrime.py

```
def CheckPrime(DataValue):  
    if DataValue <= 1:  
        return False  
  
    for i in range(2,DataValue):  
        if DataValue%i==0:  
            return False  
    return True  
  
def PrimeAddition(iData1,iData2):  
    return iData1+iData2
```
