

Python Assignment 15

1. Write a lambda function which accepts one number and returns square of that number.

Answer :

```
Square = lambda liValue : liValue * liValue

def main():
    iValue = int(input("Enter the Value : "))
    Ret = Square(iValue)
    print("Square Of area is : ",Ret)

if __name__ == "__main__":
    main()
```

2. Write a lambda function which accepts one number and returns cube of that number.

Answer :

```
Cube = lambda liValue : liValue**3

def main():
    iValue = int(input("Enter the Value : "))
    Ret = Cube(iValue)
    print("Cube Of area is : ",Ret)

if __name__ == "__main__":
    main()
```

3. Write a lambda function which accepts two numbers and returns maximum number.

Answer :

```
MinMax = lambda A, B : A if A > B else B

def main():
    iValue1 = int(input("Enter the Value 1 : "))
    iValue2 = int(input("Enter the Value 2 : "))
```

```
Ret = MinMax(iValue1, iValue2)
print("Maximum Number is : ",Ret)

if __name__ == "__main__":
    main()
```

5. Write a lambda function which accepts one number and returns True if number is even otherwise False.

Answer :

```
EvenOdd = lambda liValue : True if liValue%2==0 else False

def main():
    iValue = int(input("Enter the Value : "))
    Ret = EvenOdd(iValue)
    if Ret == True:
        print("Value is True mean Even")
    else:
        print("Value is False mean Odd")

if __name__ == "__main__":
    main()
```

6. Write a lambda function which accepts one number and returns True if number is odd otherwise False.

Answer:

```
EvenOdd = lambda liValue : True if liValue % 2 != 0 else False

def main():
    iValue = int(input("Enter the Value : "))
    Ret = EvenOdd(iValue)
    if Ret == True:
        print("Value is True mean Odd")
    else:
        print("Value is False mean Even")

if __name__ == "__main__":
    main()
```

7. Write a lambda function which accepts one number and returns True if divisible by 5.

Answer :

```
Divisibility = lambda liValue : True if liValue%5==0 else False

def main():
    iValue = int(input("Enter the Value : "))
    Ret = Divisibility(iValue)
    if Ret == True:
        print("Value is True mean Value is Divisible by 5")
    else:
        print("Value is False Mean Not Divisible by 5")

if __name__ == "__main__":
    main()
```

8. Write a lambda function which accepts two numbers and returns addition.

Answer :

```
Addition = lambda liValue1, liValue2 : liValue1 + liValue2

def main():
    iValue1 = int(input("Enter the Value 1 : "))
    iValue2 = int(input("Enter the Value 2 : "))
    Ret = Addition(iValue1, iValue2)
    print("Addition is : ",Ret)

if __name__ == "__main__":
    main()
```

9. Write a lambda function which accepts two numbers and returns multiplication.

Answer :

```
Multiplication = lambda liValue1, liValue2 : liValue1 * liValue2

def main():
    iValue1 = int(input("Enter the Value 1 : "))
```

```
iValue2 = int(input("Enter the Value 2 : "))
Ret = Multiplication(iValue1, iValue2)
print("Multiplication is : ",Ret)

if __name__ == "__main__":
    main()
```

10. Write a lambda function which accepts three numbers and returns largest number.

Answer :

```
BigValue = lambda liValue1, liValue2, liValue3 : (
    liValue1 if liValue1 > liValue2 and liValue1 > liValue3
    else liValue2 if liValue2 > liValue1 and liValue2 > liValue3
    else liValue3)

def main():
    iValue1 = int(input("Enter the Value 1 : "))
    iValue2 = int(input("Enter the Value 2 : "))
    iValue3 = int(input("Enter the Value 3 : "))

    Ret = BigValue(iValue1, iValue2, iValue3)
    print("Big Value is : ",Ret)

if __name__ == "__main__":
    main()
```
