

# Python Assignment 16

1. Write a program which contains one function named as Fun(). That function should display "Hello from Fun" on console.

Answer :

```
def Fun():  
    print("Hello from Fun")  
  
def main():  
    Fun()  
  
if __name__ == "__main__":  
    main()
```

2. Write a program which contains one function named as ChkNum() which accept one parameter as number. If number is even then it should display "Even number" otherwise display "Odd number" on console.

Input : 11 Output : Odd Number

Input : 8 Output : Even Number

Answer :

```
def ChkNum(iNum):  
    if iNum%2==0:  
        print("Even Number")  
    else:  
        print("Odd Number")  
  
def main():  
    print("Enter the Number :")  
    Num = int(input())  
    ChkNum(Num)  
  
if __name__ == "__main__":  
    main()
```

3. Write a program which contains one function named as Add() which accepts two numbers from user and return addition of that two numbers.

Input : 11 5

Output : 16

Answer :

```
def Add(iNum1,iNum2):
    return iNum1 + iNum2

def main():
    print("Enter the Number 1 :")
    Num1 = int(input())
    print("Enter the Number 1 :")
    Num2 = int(input())

    Ret = Add(Num1,Num2)
    print(Ret)

if __name__ == "__main__":
    main()
```

4. Write a program which display 5 times Marvellous on screen.

Output :

Marvellous  
Marvellous  
Marvellous  
Marvellous  
Marvellous

Answer :

```
def main():
    print("Marvellous\n"*5)

if __name__ == "__main__":
    main()
```

5. Write a program which display 10 to 1 on screen.

Output : 10 9 8 7 6 5 4 3 2 1

Answer :

```
def main():
    for i in range(10,0,-1):
        print(i)

if __name__ == "__main__":
    main()
```

6. Write a program which accept number from user and check whether that number is positive or negative or zero.

Input : 11

Output : Positive Number

Input : -8

Output : Negative Number

Input : 0

Output : Zero

Answer :

```
def main():
    print("Enter the Number")
    Num = int(input())
    if Num >= 1:
        print("Positive")
    elif Num <= -1:
        print("Negative")
    else:
        print("Zero")

if __name__ == "__main__":
    main()
```

7. Write a program which contains one function that accept one number from user and returns true if number is divisible by 5 otherwise return false.

Input : 8      Output : False

Input : 25      Output : True

Answer :

```
def bool(iNo):
    if iNo%5 == 0:
        return True
    else:
        return False

def main():
    print("Enter the Numbetr")
    No = int(input())
    Ret = bool(No)
    print(Ret)

if __name__ == "__main__":
    main()
```

8. Write a program which accept number from user and print that number of "\*" on screen.  
Input : 5 Output : \* \* \* \* \*

Answer :

```
def main():  
    print("Enter the Number")  
    No = int(input())  
    print("* " * No)  
  
if __name__ == "__main__":  
    main()
```

9. Write a program which display first 10 even numbers on screen.  
Output : 2 4 6 8 10 12 14 16 18 20

Answer :

```
def main():  
    count = 0  
    num = 2  
  
    while count < 10:  
        print(num)  
        num += 2  
        count += 1  
  
if __name__ == "__main__":  
    main()
```

10. Write a program which accept name from user and display length of its name.  
Input : Marvellous Output : 10

Answer :

```
def main():  
    print("Enter the name")  
    Name = input()  
    print(len(Name))  
  
if __name__ == "__main__":  
    main()
```
